## CERTIFICATE

This is to certify that the Seminar Work entitled “**Novel Perspective on Doxing and Its Mitigation**” is the bonafide work carried out by **DHANUSH GOWDA G P (4AD20CS023)** in partial fulfillment for the award of degree of Bachelor of Engineering in Computer Science and Engineering from Visvesvaraya Technological University, Belagavi during the year 2023-2024.

---

**Signature of the Guide**

Mrs. Shrilakshmi Prasad  
Assistant Professor  
Dept. of CSE

---

**Signature of the Coordinator**

Dr. J V Gorabal  
Professor  
Dept. of CSE

---

**Signature of the HoD**

Dr Puttegowda D  
Professor & HoD  
Dept. of CSE

## ACKNOWLEDGEMENT

The successful completion of my work would be incomplete without the mention of the names of the people who have made it possible. I am indebted to several individuals who have helped me to complete the report.

I am thankful to **Dr. L Basavaraj, Principal, ATME College of Engineering, Mysuru,** for having supported us in our academic endeavors.

I am extremely thankful to **Dr. Puttegowda D, Professor and HOD, Department of Computer Science and Engineering,** for his valuable support and his timely inquiries into the progress of the work.

I express my earnest gratitude towards my seminar coordinator **Dr. J V Gorabal, Professor, Department of Computer Science and Engineering,** who helped me in getting things done.

I am greatly indebted to my guide **Mrs. Shrilakshmi Prasad, Assistant Professor, Department of Computer Science and Engineering,** for her consistent co-operation and support.

I am obliged to all **teaching and non-teaching staff members of Department of Computer Science and Engineering, Mysuru** for the valuable information provided by them in their respective fields. I am grateful for their co-operation during the period of our project.

Lastly, I thank almighty, parents and friends for their constant encouragement and support, for helping me in completing the seminar successfully.

**DHANUSH GOWDA G P(4AD20CS023)**

## **ABSTRACT**

Doxing, the malicious act of exposing an individual's private and sensitive information has emerged as a significant threat in the digital age. This study explores novel perspectives in understanding doxing, its evolving techniques, and innovative strategies for its mitigation. Our research delves into the intricacies of doxing, shedding light on emerging tactics employed by malicious actors in an era of increased online information sharing. We examine the psychological and sociological factors that drive doxing incidents, providing fresh insights into the motivations behind such attacks. This paper presents a holistic approach to doxing mitigation, incorporating technical, legal, and educational strategies. We discuss the importance of proactive threat intelligence sharing, the development of advanced privacy protection tools, and legal frameworks to hold doxers accountable. Additionally, we emphasize the role of cybersecurity awareness and digital hygiene practices in reducing individual susceptibility to doxing. In a rapidly evolving digital landscape, this research offers a forward-looking perspective on the challenges posed by doxing and provides valuable guidance for individuals, organizations, and policymakers seeking effective mitigation strategies. Keywords- Cyber Security, Doxing, Malicious.

## TABLE OF CONTENTS

| Sl. No. | Title                                       | Pg. No. |

## **CHAPTER 1**

### **INTRODUCTION**

Doxing, a term derived from "dropping documents," involves the public exposure of personally identifiable information about individuals or organizations without their consent, typically over the internet. This act, often associated with cyberbullying, can have severe implications, ranging from embarrassment and harassment to financial harm and even physical threats. The motivations behind doxing vary, including seeking revenge, intimidation, or vigilante actions. While some instances of doxing may be justified, such as when revealing harmful behavior aligns with public interest, the negative consequences of this practice are significant.

In recent years, the rise of doxing has prompted a parallel evolution in cybersecurity and online privacy measures, leading to the emergence of anti-doxing services and initiatives aimed at protecting individuals and organizations from such malicious exposure. Institutions like the University of California Berkeley have taken proactive steps to provide guidance on safeguarding against doxing, reflecting a growing awareness of the risks associated with this practice.

Mitigating the risks of doxing requires a multifaceted approach, encompassing both proactive and reactive measures. Individuals are advised to conduct regular online audits, secure their personal information, and limit its accessibility to mitigate the potential impact of doxing. Organizations, on the other hand, should prioritize data protection, employee education, and incident response strategies to address and prevent doxing incidents effectively.

Understanding the complexities of doxing, its motivations, and the evolving landscape of online privacy and security is crucial in developing robust mitigation strategies. By exploring novel perspectives on doxing and its implications, stakeholders can better navigate the challenges posed by this digital threat and work towards creating a safer online environment for individuals and organizations alike.

## **1.1 Objective**

1. Define doxing and its various motivations, including revealing harmful behavior, embarrassment, intimidation, and punishment.
2. Explore the History surrounding doxing, particularly the lack of adequate federal laws.
3. Analyze the rise of anti-doxing services and initiatives, such as those provided by the University of California Berkeley, in response to the growing threat of doxing.
4. Identify proactive and reactive measures individuals can take to protect themselves from doxing, including conducting regular online audits, securing personal information, and limiting its accessibility.
5. Identify proactive and reactive measures individuals can take to protect themselves from doxing, including conducting regular online audits, securing personal information, and limiting its accessibility
6. Provide insights into the motivations and targets of adolescents who engage in doxing, highlighting the need for awareness and policy approaches to combat this problem.

## CHAPTER 2

### LITERATURE SURVEY

#### **1. “Cyberbullying: A Systematic Literature Review to Identify the Factors Impelling University Students Towards Cyberbullying” (August 2020):**

Prior research has heavily focused on school students and has mostly ignored university students. Therefore, this study aims to conduct a systematic review of literature targeting university students specifically to understand the underlying causes that give rise to the problem of cyberbullying within the university environment so that the issue could be adequately addressed. In this attempt, this study observed 32 studies out of a total of 7,939 reviews searched for the purpose.

#### **2. “Doxing: What Adolescents Look for and Their Intentions” (January 2022):**

Doxing is a form of cyberbullying in which personal information on others is sought and released, thereby violating their privacy and facilitating further harassment. This study examined adolescents’ doxing participation using a representative sample of 2120 Hong Kong secondary school students.

#### **3. "Doxing: a conceptual analysis" (September 2023):**

Doxing is the intentional public release onto the Internet of personal information about an individual by a third party, often with the intent to humiliate, threaten, intimidate, or punish the identified individual. In this paper I present a conceptual analysis of the practice of doxing and how it differs from other forms of privacy violation.

#### **4. " Cyber-attacks: A literature Survey " (July 2022):**

study discusses practical considerations for implementing spam filtering systems in university networks. It emphasizes the importance of scalability, compatibility with existing email infrastructure, and user education in effectively combating email spam.

**5. " Doxxing: A Scoping Review and Typology" (June 2021):**

This paper compares the performance of different anti doxing techniques, a typology of this form of technology-facilitated violence (TFV) that expands understandings of doxing, its forms and its harms, beyond a taciturn discussion of privacy and harassment online.

**6. " Cyberbullying Hurts: The Rising Threat to Youth in The Digital Age" (2021):**

This study evaluates Cyberbullying refers to the behavior of inflicting harm upon a certain individual or group by using information or communication technologies. Although it originally became a topic of discussion in Europe and North America, it has now become a worldwide issue

## **CHAPTER 3**

# **HISTORY OF DOXING**

### **1 Early Instances (1990s- 2000s)**

The practice of exposing personal information predates the term "doxing." In the early days of the internet, individuals were occasionally targeted through online forums, chat rooms, or email, with their private information exposed by malicious actors. However, these incidents were relatively isolated and lacked a widely recognized term..

### **2. Emergence of "Doxing" (2000s):**

The term "doxing" gained popularity in the 2000s as online communities and social networks flourished. It became the colloquial name for the act of searching, collecting, and publishing an individual's private information, often including home addresses, phone numbers, email addresses, and workplace details. While doxing could be motivated by various factors, including revenge, harassment, or activism, it primarily served as a tool for online intimidation and retribution.

### **3. Activism and Hacktivism (Late 2000s – Early 2010s):**

Doxing took on new dimensions as hacktivist groups like Anonymous used it as a means of exposing perceived wrong doers. Targets ranged from corporations involved in controversial practices to individuals engaged in unlawful activities. These actions blended the concepts of online vigilantism and doxing, leading to heightened media attention.

### **4. Social Media and Public Figures (2010s)**

The rise of social media platforms provided doxers with more accessible and extensive sources of information, increasing the vulnerability of individuals and public figures. Notable instances include celebrities, politicians, and journalists experiencing doxing, often resulting in harassment, threats, and real-world consequences.

### **5. Commercialization and Doxing-as-a-Service (Late 2010s- 2020s):**

In recent years, the landscape of doxing has evolved further, with the emergence of commercial doxing services. These services offer the doxing of targets for a fee, illustrating the growing commodification of this practice. It is no longer confined to individuals with technical skills but can be employed by virtually anyone with financial means, amplifying the risks.

### **6. Doxing using Artificial Intelligence (2020s- present):**

Doxing using AI involves the utilization of artificial intelligence technologies to compile and disseminate personal information about individuals without their consent. AI algorithms can automate the aggregation and analysis of data obtained from various sources like websites, public databases, and social media posts to extract sensitive information such as contact details, personal experiences, or private data that individuals may not want to be shared.

## CHAPTER 4

### CURRENT TRENDS

These current trends in doxing highlight the multifaceted nature of the threat, with far-reaching consequences not only for individual victims but also for society, online discourse, and the broader digital landscape.

#### 4.1. Doxing Trends and Their Adverse Impacts:

- **Commercialization:** Increased accessibility to doxing services. More widespread doxing incidents, as individuals or groups with financial means can hire doxers. Escalation of cyberbullying and harassment.
- **Social Media Exposure:** Easier access to personal information via social media. Targets include public figures, celebrities, and individuals who share personal data online. Heightened risk of online harassment and offline stalking.
- **Doxing-as-a-Service:** Emergence of businesses offering doxing services for profit. Easy outsourcing of doxing attacks, reducing the technical knowledge barrier. Greater anonymity for those ordering doxing services, making it challenging to trace perpetrators.- Proliferation of malicious intent and attacks.
- **Political Doxing:** Doxing related to political ideologies, activism, and online debates. Polarization and intimidation of individuals or groups with opposing views.
- **Information Leaks:** Hacks, data breaches, and insider threats leading to the exposure of sensitive data. Exacerbation of doxing incidents due to the availability of extensive personal and confidential information. Increased risk of identity theft and financial fraud.

- **Swatting:** Doxers falsely report serious incidents, such as bomb threats or shootings, at a target's location to trigger a SWAT team response. Potential for injury, loss of life, and emotional trauma. The strain on law enforcement resources and costly consequences for victims.
- **Privacy Erosion:** Encouragement of self-censorship as individuals fear sharing personal information online. Erosion of privacy in the digital age, with potential long-term psychological effects. Loss of trust in online communities and platforms
- **Legal Consequences:** Countries introducing anti-doxing laws with varying levels of severity. Criminal charges and legal action against doxers. Balancing the protection of free speech with privacy concerns.
- **Online Vigilantism:** Individuals and groups taking the law into their own hands to expose perceived wrongdoers. The risk of false accusations and damage to innocent parties. Potential for escalation into real-world confrontations and violence.
- **Cultural and Social Impact:** Shaping societal attitudes and behaviors concerning online interactions and privacy. Influence the way organizations and platforms handle user data and protect users from doxing. Ongoing debates about the balance between online freedom and security.

## CHAPTER 5

### METHODOLOGY

#### 5.1. Social Network Algorithm (SNA):

Social network algorithms are sets of rules, signals, and data that govern how content is filtered, ranked, and recommended to users on social media platforms. The primary purpose of these algorithms is to sort and match content to users with similar preferences, enhancing the user experience by showing them more of what they are interested in and filtering out irrelevant or low-quality content. Social media algorithms leverage user behavior, interactions, and interests to understand content preferences and deliver personalized content tailored to individual users. By analyzing data such as actions, behaviors, and interests, these algorithms aim to prolong user engagement, improve content visibility, and create a positive user experience by showing relevant and engaging content to users.

The functioning of social network algorithms differs from platform to platform and is constantly evolving as they learn from user behavior. While the details of each platform's algorithm are closely guarded secrets, social media networks have become more transparent in recent years about their general ranking signals and how their algorithms work.

Some of the most common ranking signals used by social media algorithms include:

1. User engagement metrics (likes, shares, comments, etc.).
2. Post frequency and timing.
3. Content quality and relevance.
4. User interests and preferences.
5. Platform-specific criteria (e.g., keywords for Twitter, hashtags for Instagram).

To succeed with social network algorithms, content creators and brands need to understand the specific ranking signals for each platform and adapt their strategies accordingly.

Fig 5.1. Block diagram of social network analysis process.

## 5.2. SNA Working:

The SNA algorithm works in six stages:

1. **Network Representation:** The first step in SNA involves representing the social network as a graph, where individuals (nodes) are connected by relationships or interactions (edges). Depending on the context, nodes could represent people, organizations, or other entities, while edges could represent various types of relationships such as friendship, collaboration, communication, etc.
2. **Node and Edge Attributes:** In addition to the basic network structure, SNA algorithms may consider additional attributes associated with nodes and edges. These attributes could include demographic information about individuals (e.g., age, gender), metadata about relationships (e.g., frequency of communication), or contextual information (e.g., timestamps, content of interactions).
3. **Propagation Models:** Propagation models simulate the spread of influence, information, or behaviors through the network. These models can help predict how trends or ideas will propagate within the network and identify influential individuals who are likely to drive the spread.
4. **Centrality Measures:** Centrality measures are used to identify the most important or influential nodes in the network. Common centrality measures include: Degree centrality: Number of connections a node has. Betweenness centrality: Measure of a node's importance in facilitating communication between other nodes.
5. **Community Detection:** Community detection algorithms partition the network into clusters or communities of nodes that are densely connected internally but sparsely connected to nodes outside the community. Community detection helps identify groups of individuals with similar interests, affiliations, or roles within the network.

6. **Graph Algorithms:** In addition to specific SNA techniques, general-purpose graph algorithms may also be used in social network analysis. For example:
  - Shortest path algorithms: Find the shortest path between two nodes in the network.
  - Clustering algorithms: Group nodes with similar attributes or connectivity patterns
7. **Visualization:** Visualization techniques are often used to explore and communicate insights from social network analysis. Graph visualization tools can display the network structure, highlight important nodes or communities, and provide interactive interfaces for exploring the data.

Overall, SNA algorithms provide valuable insights into the structure, dynamics, and behavior of social networks, enabling applications such as targeted marketing, community detection, influence analysis, and understanding the spread of information or influence in online and offline communities.

Fig 5.2. Block diagram of Malware Detection.

## CHAPTER 6

### MITIGATION MEASURES

Preventing doxing attacks involves a combination of technical and non-technical measures. While it is challenging to create a purely mathematical model for prevention, we can use a simplified representation to describe the key components and their interplay. The following mathematical model outlines the elements that contribute to preventing doxing attacks, Let:

**P(D)** be the probability of a doxing attack occurring.

**P(Pr)** be the probability of personal information being exposed.

**P(T)** be the probability of successful doxing,

given that personal information is exposed. **P(PrC)** be the probability of personal information remaining confidential. **P(E)** be the probability of personal information being used for malicious purposes. We can now formulate a simple mathematical model for preventing doxing attacks:

$$\mathbf{P(D)=1-P(PrC)}$$

$$\mathbf{P(PrC)=1-P(Pr)}$$

$$\mathbf{P(E)= P(Pr)*P(T)}$$

The model breaks down as follows:

**P(PrC)** is the probability of personal information remaining confidential. It is inversely related to the probability of personal information being exposed (**P(Pr)**). The more successful measures you have in place to protect personal information, the higher the probability of it remaining confidential and the lower the overall risk of a doxing attack.

**P(E)** represents the probability of personal information being used for malicious purposes and it is dependent on the probabilities of personal information being exposed (**P(Pr)**) and the success of doxing (**P(T)**). This highlights that even if personal information is exposed preventing the success of doxing can reduce the likelihood of malicious use.

This model shows the importance of minimizing the exposure of personal information( $P(Pr)$ ) and preventing the success of doxing( $P(T)$ ) to reduce the risk of doxing attacks( $P(D)$ ). However, it's important to note that in practice, the effectiveness of prevention measures is influenced by a wide range of factors, including the specific security measures in place, the level of security awareness, and the evolving tactics of attackers. Therefore, the real-world prevention of doxing attacks requires a comprehensive approach that goes beyond mathematical modeling, incorporating a combination of technical, procedural, and educational efforts.

Mitigating and preventing doxing is crucial to protect individuals and organizations from the malicious exposure of private information. Implementing a combination of technical, procedural, and educational measures can significantly reduce the risk of doxing. Here are some effective mitigation and prevention measures [3, 4]:

### **6.1. Methods against doxing**

- **Data Minimization:** Collect and store the minimum amount of personal information necessary for your operations. Reducing the amount of available data can make doxing attempts less damaging.
- **Data Encryption:** Encrypt sensitive data to protect it from unauthorized access. This ensures that even if data is exposed, it remains unreadable without the decryption key.
- **Access Controls:** Implement strict access controls and user authentication to limit the number of individuals who can access sensitive information. Regularly review and update access permissions.
- **Cybersecurity Awareness Training:** provides employees and users with training on recognizing phishing attacks. Teach them to protect their online presence.
- **Secure Social Media Practices:** Encourage users to set privacy settings on social media platforms to limit the visibility of personal information. Avoid sharing sensitive data online.
- **Two-Factor Authentication (2FA):** Require 2FA for accessing sensitive accounts and services. This provides an additional layer of security against unauthorized access.
- **Email Security:** Use email filtering tools to block malicious emails and phishing attempts. Train users to recognize suspicious emails and attachments.

## CHAPTER 7

### Prevention Measures

- **Personal Data Protection:** As an individual, be cautious about sharing personal information online. Limit the amount of information you disclose on social media and other websites.
- **Secure Passwords:** Use strong, unique passwords for online accounts. Consider using a password manager to generate and store complex passwords.
- **Online Privacy Settings:** Regularly review and adjust privacy settings on social media and other online profiles to restrict who can access your personal information.
- **Pseudonymity:** Consider using pseudonyms or nicknames online rather than your real name. This can help protect your identity.
- **Email and Phishing Awareness:** Be vigilant about email phishing attempts. Avoid clicking on suspicious links or downloading attachments from unknown sources.
- **Anonymous Browsing:** Use tools like VPNs (Virtual Private Networks) to browse the internet more anonymously, making it harder for doxers to track your online activities.
- **Digital Literacy:** Develop your digital literacy skills to better understand online threats and security. Stay informed about evolving doxing techniques.
- **Secure Your Devices:** Keep your devices and software up to date with the latest security patches and updates. Use security software to protect against malware.
- **Legal Safeguards:** Be aware of the legal protections and resources available to you if you become a victim of doxing. Consult with law enforcement and legal professionals when necessary.
- **Online Community Guidelines:** Follow the guidelines of online communities and platforms to inform moderators or admins about any abusive or doxing behavior.

Mitigating and preventing doxing is an ongoing process that requires a combination of proactive measures, user awareness, and adaptability. Staying vigilant, fostering a culture of cybersecurity, and implementing robust security practices are essential for protecting against doxing in the digital age.

## **CHAPTER 8**

### **IMPLEMENTATION AND RESULTS**

Parallel to the rise of doxing has been the evolution of cybersecurity, internet privacy, the Online Privacy Alliance, and companies that provide anti-doxing services. Most recently, high-profile groups like the University of California Berkeley have made online guidance for protecting its community members from doxing. Wired published an article on dealing with doxing, in which Eva Galperin, from the Electronic Frontier Foundation, advised people to “Google yourself”, lock yourself down, make it harder to access information about you. few countries with a criminal statute that specifically addresses doxing. Article of "Act on promotion of information and communications network utilization, and information protection" prohibits unlawful collection and dissemination of private information such as full name, birth date, address, likeness, and any other information that is deemed sufficient to identify specific person(s) when viewed in summation, regardless of intent. In practice, however, due to the ambiguous nature of "unlawful collection" of private information in the statute, legal actions are often based upon article from the same act, which prohibits insulting an individual with derogatory or profane language, and defamation of an individual through the dissemination of either misinformation or privileged factual information that may potentially damage an individual's reputation or honor (which often occurs in a doxing incident). This particular clause enforces harsher maximum sentences than a "traditional" defamation statute existing in the criminal code. It was originally enacted partially in response to the rise in celebrity suicides due to cyberbullying.

Fig 7.1. Data from 2009-2019 increase in site (data by google)

**Advanced Machine Learning and AI Solutions:** Investigate the development of machine learning and artificial intelligence (AI) models for early detection and prevention of doxing attacks. Research could focus on improving the accuracy of predictive models to identify potential doxing threats based on online behavior, language, and data patterns.

Fig 7.2. Data of doxing through years.

Fig 7.3. Data from 2020 with increase in cyber warfare.

**Privacy-Preserving Technologies:** enhance privacy preservation while still enabling legitimate data sharing and communication. Research in this area could include new cryptographic methods, decentralized identity management, and secure data-sharing protocols.

Fig 7.4. Data showing number of effected countries in the world.

**Fig 7.4. Data showing number of attacks in minutes by Microsoft in 2022.**

**Counter-Doxing Strategies:** Investigate counter-doxing techniques and technologies that empower individuals and organizations to defend against doxing attempts. This could involve developing tools and best practices for tracking and responding to doxing incidents in real-time.

**Legal and Ethical Frameworks:** Research the legal and ethical implications of doxing in different jurisdictions. Examine the effectiveness of current legislation, the need for international cooperation, and ethical guidelines for online behavior, with a focus on striking a balance between free speech and privacy protection.

## CONCLUSION

novel perspectives in doxing and its mitigation have unveiled the dynamic landscape of online threats in the digital age. Doxing, once considered a fringe activity, has now become a pervasive and potent danger, targeting individuals and organizations alike. Our examination of emerging trends, such as doxing as-a-service, underscores the growing commercialization of this menace. However, the research also demonstrates the proactive steps that can be taken to mitigate doxing risks. New mitigation strategies, including comprehensive threat intelligence sharing, data minimization, and the deployment of advanced machine learning algorithms, offer promising avenues for defenses against doxing attacks.

These research directions are critical for advancing the field of doxing prevention and mitigation, helping to develop effective strategies, technologies, and policies to protect individuals and organizations from the negative impacts of doxing in an ever-evolving digital landscape. These novel perspectives emphasize the importance of staying ahead of adversaries in the ever-evolving realm of cybersecurity. As technology continues to advance and threats evolve, the fight against doxing will require ongoing adaptation, collaboration, and vigilance to safeguard digital identities and privacy in an interconnected world.
