ACKNOWLEDGEMENT

The successful completion of our mini project work would be incomplete without the mention of the names of the people who made it possible.

We are thankful to **Dr. L Basavaraju, Principal, ATME College of Engineering, Mysuru** for having supported us in our academic endeavors by granting us permission and extended full use of the college facilities to carry out this mini project successfully.

We are extremely thankful to **Dr. Puttegowda D, Professor and Head of the Department, Department of Computer Science and Engineering**, for his valuable support and his timely inquiries into the progress of the work.

We express our earnest gratitude towards our guide **Mrs. Kavyashree E D, Assistant Professor, Department of Computer Science and Engineering**, for her consistent cooperation and support in getting things done.

We are obliged to all **teaching and non-teaching staff members of Department of Computer Science and Engineering** for the valuable information provided by them in their respective fields.

Lastly, we thank almighty, our parents and friends for their constant encouragement and courage, for helping us in completing the mini project report successfully.

Abhishek M(4AD20CS002)

Dhanush Gowda G P (4AD20CS023)

ABSTRACT

Online Marriage Registration System is responsible for keeping all the record of marriages. This system registers the marriage and generate marriage certificate.

The main objective of “Online Marriage Registration System” project is to be providing easier registration of marriage and gets marriage certificate online which save lots of time.

Online Marriage Registration System is a database management system project that provides a platform for couples to apply for and receive their marriage certificates electronically.

This system automates the traditional manual process, reduces processing time and increases accuracy and security of marriage records. The system utilizes a user-friendly interface, where couples can fill in the required information and upload necessary documents online. The database is used to store, manage and retrieve marriage records, and includes functionalities such as data validation, real-time status updates, and digital certificate issuance.

With the Online Marriage Registration System, the goal is to create a more efficient, transparent and accessible process for couples to legally register their marriages.

Chapter 1

INTRODUCTION

Online Marriage Registration System is a web-based technology that will manage the records of the marriage and generate marriage certificate. It's an easy for Admin to retrieve the data of marriage couple. Online Marriage Registration System is an automatic system which delivers data processing in very high speed in systematic manner. In Online Marriage Registration System, we use PHP and MySQL Database. This project has two modules i.e., admin and user.

1.1 Admin Module

- **Dashboard** In this section, admin can briefly view the total number of the new applications, total verified application and total rejected the application.
- **Application:** In this section, admin views the application details and they have also the right to change application status according to current status.
- **Reports:** In this section admin can view the application details in a particular period.
- **Search:** In this section, admin can search application with the help of user registration number Admin can also update his profile, change the password and recover the password.

1.2 User Module

- **Dashboard:**
In this section, user can view the welcome page of the web application.
- **Registration Form:**
In this section, user can fill the form of marriage registration.

1.3 View Marriage Application:

In this section, user can take print of verified certificates of marriage.

- **Purpose: -**

The main purpose of developing Online Marriage Registration System is to computerized the tradition way of registering marriage. Another purpose for developing this application is to generate

the report automatically. This software design specification is made with the purpose of outlining the software architecture and design of the Marriage Registration System in detail.

- **Scope:**

The Software design document would demonstrate how the design will accomplish the functional and non- functional requirements captured in the Software Requirement specification (SRS). The document will provide a framework to the programmers through describing the high-level components and architecture, sub systems, interfaces, database design and algorithm design. This is achieved through the use of architectural patterns, design patterns, sequence diagrams, class diagrams, relational models and user interfaces.

Online Marriage Registration Script helps to start your own online marriage registration system to manage marriage new applications, verifying the application, approving the application, and generating certificates accordingly. Marriage registration is one of the most important tasks connecting to a wedding. Online Marriage Registration help us will to manage all marriage registration related applications online, so we can check the data whenever we need it from anywhere on any device. Online Marriage Registration Software admin has all the privileges to manage new applications, verified, rejected applications, reports, and other details. Likewise users are able to login into the marriage registration portal, fill the online registration form, view marriage form and are able to download marriage certificate after approved by the admin.

Chapter 2

Requirement Specification

2.1 Hardware Configuration:

- **Client side:**

RAM	512 MB
Hard disk	10 GB
Processor	1.0 GHz

- **Server side:**

RAM	1 GB
Hard disk	20 GB
Processor	2.0 GHz

2.2 Software Requirement:

- **Client side:**

Web Browser	Google Chrome or any compatible browser
Operating System	Windows or any equivalent OS

- **Server side:**

Web Server	APACHE
Server side Language	PHP5.6 or above version
Database Server	MYSQL
Web Browser	Google Chrome or any compatible browser
Operating System	Windows or any equivalent OS

2.3 APACHE

The Apache HTTP Server Project is an effort to develop and maintain an open-source HTTP server for modern operating systems including UNIX and Windows. The goal of this project is to provide a secure, efficient and extensible server that provides HTTP services in sync with the current HTTP standards.

The Apache HTTP Server ("httpd") was launched in 1995 and it has been the most popular web server on the Internet since April 1996. It has celebrated its 20th birthday as a project in February 2015.

PHP

- PHP stands for PHP: Hypertext Preprocessor.
- PHP is a server-side scripting language, like ASP.
- PHP scripts are executed on the server.
- PHP supports many databases (MYSQL, Informix, Oracle, Sybase, Solid, Generic ODBC, etc.).
- PHP is an open-source software.

2.4 Back End

The back end is implemented using MySQL which is used to design the databases.

MySQL

- MYSQL is a database server
- MYSQL is ideal for both small and large applications
- MYSQL compiles on a number of platforms
- MYSQL is free to download and use
- How to access MySQL: <http://localhost/phpmyadmin>

Chapter 3

Analysis and Design

Analysis:

In present all marriage registration work done on the paper. The whole year data is stored in the registers. We can't generate reports as per our requirements because its take more time to calculate report of marriage.

Disadvantage of present system:

- **Not user friendly:** The present system not user friendly because data is not stored in structure and proper format.
- **Manual Control:** All report calculation is done manually so there is a chance of error.
- **Lots of paper work:** Visitors maintain in the register so lots of paper require storing details.

3.1 Design Introduction:

Design is the first step in the development phase for any techniques and principles for the purpose of defining a device, a process or system in sufficient detail to permit its physical realization.

Once the software requirements have been analyzed and specified the software design involves three technical activities - design, coding, implementation, and testing that are required to build and verify the software.

The design activities are of main importance in this phase, because in this activity, decisions ultimately affecting the success of the software implementation and its ease of maintenance are made. These decisions have the final bearing upon reliability and maintainability of the system. Design is the

only way to accurately translate the customer's requirements into finished software or a system.

Design is the place where quality is fostered in development. Software design is a process through which requirements are translated into a representation of software. Software design is conducted in two steps. Preliminary design is concerned with the transformation of requirements into data.

3.2 UML Diagrams:

Actor:

A coherent set of roles that users of use cases play when interacting with the use cases.

Use case: A description of sequence of actions, including variants, that a system performs that yields an observable result of value of an actor.

UML stands for Unified Modeling Language. UML is a language for specifying, visualizing and documenting the system. This is the step while developing any product after analysis. The goal from this is to produce a model of the entities involved in the project which later need to be built.

3.3 Use Case Diagrams:

3.3.1 Admin

3.3.2 User

Chapter 6

Implementation and System Testing

After all phase have been perfectly done, the system will be implemented to the server and the system can be used.

6.1 System Testing

The goal of the system testing process was to determine all faults in our project .The program was subjected to a set of test inputs and many explanations were made and based on these explanations it will be decided whether the program behaves as expected or not. Our Project went through two levels of testing

1. Unit testing
2. Integration testing

6.2 Unit Testing

Unit testing is commenced when a unit has been created and effectively reviewed .In order to test a single module we need to provide a complete environment i.e. besides the section we would require

- The procedures belonging to other units that the unit under test calls
- Non local data structures that module accesses
- A procedure to call the functions of the unit under test with appropriate parameters
- **Report Generation:** admin can generate report from the main database.

6.3 integration testing

In the Integration testing we test various combination of the project module by providing the input. The primary objective is to test the module interfaces in order to confirm that no errors are occurring when one module invokes the other module.

7.6 New Application

The image shows a user registration form for the OMRS (Online Marriage Registration System). The form is titled "User Registration Form" and is located on the right side of a dark blue background. The form contains the following fields:

- First Name:
- Last Name:
- Mobile Number:
- Address:
- Password:

Below the password field is a "Sign Up" button. At the bottom of the form, there is a link: "Do you have an account ? || [signin](#)".

On the left side of the form, there is an orange vertical banner with the text "OMRS" and "Fill the form for registration". Below this, there is a paragraph of placeholder text: "Donec quam felis, ultricies nec, pellentesque eu, pretium quis, sem. Nulla consequat massa quis enim. Donec pede justo, fringilla vel, aliquet nec, vulputate." At the bottom of the banner is a link: "Back Home".

At the bottom of the page, there is a copyright notice: "Copyright © 2017. All Rights Reserved. Amanda by ThemePixels".

CONCLUSION

This Application provides a computerized version of Marriage Registration which will benefit the people who want to register their marriage.

It makes the entire process online and can generate reports. It has a facility of admin login where admin can fill the marriage details and generate marriage certificate.

The Application was designed in such a way that future changes can be done easily. The following conclusions can be deduced from the development of the project.

- Automation of the entire system improves the productivity.
- It provides a friendly graphical user interface which proves to be better when compared to the existing system.
- It gives appropriate access to the authorized users depending on their permissions.
- It effectively overcomes the delay in communications.
- Updating of information becomes so easier.
- System security, data security and reliability are the striking features.
- The System has adequate scope for modification in future if it is necessary.

FUTURE SCOPE

I have tried to design the software in such a way that the user may not have any difficulty in using this system and further expansion is also possible. New requirements will be added and risk will be analyzed in every phase until the requirement of user will not be fulfilled. The most priority will be given to keep confidential data secure and easy and simple for use.

The further enhancements which can be made in the system are:

- Any requirement that will make system easy to use or make a system secure, these requirement will be add using Spiral Model. Other requirement related to government or municipality will be added when required.
- For the identity of user and for their data integrity, digital signature can be added to this system.
- For the identity of user and for verification, image of user can be added to this system.
- There will be provision of filling form in multiple languages.
- A great concern will be given on frontend design which will make user to use system easily and enjoy while using this system.
